Dutify WooCommerce Plugin – Quick Start & Configuration Guide

Version: 2.6.0

- Setup
  - Plugin Installation
  - Retrieving API Key
  - New Attributes
  - Product Classification
    - Retrieving Classification IDs
    - Other Classification Methods
  - Configuring Supported Countries
- Plugin Settings
- Order Management & Audit
  - Fulfilling Cross-border orders
  - Auditing Calculations

Setup

Plugin Installation

Use the WooCommerce plugin installation tool to install the Dutify plugin. If upgrading from a previous version, **deactivate and delete** the old plugin before installing the new one.

1. In WordPress admin, go to **Plugins** → **Add New**.
2. Click **Upload Plugin**.
3. Click **Choose File** and select the Dutify `.zip` file and click **Install Now**.
4. Once installed, click **Activate Plugin.**
5. Verify it appears on the Plugins page. If it's not highlighted in blue, delete and reinstall.

Retrieving API Key

Once installed, retrieve an API key from Dutify. This requires an account plan that has API access.

1. On Dutify.com go to **Account** → **API Access.**
2. Copy the API Key at the top of the page.
3. In WooCommerce, go to **Settings** → **Dutify.**
4. Paste the API Key into the **API Token** field and **Save Changes.**

New Attributes

As part of the plugin installation, four new global product attributes will be created in WooCommerce. These attributes, along with their values can be added to each product but are **not required** for the plugin to work:

Attribute	Purpose	Example
Dutify Classification ID	Assigns a product to a specific Dutify category for the most accurate duty and tax calculation.	`2549` (retrieved from Dutify - more info below)
Dutify Country of Origin	Specifies the product's country of origin, used for preferential rates and certain tariff calculations. If not set, the store's location will be used.	`AU` for Australia - (use the ISO 3166 country code. Any other value will prevent calculation)
Dutify HS Code	Classifies the product using an HS code (full or partial).	`8471.30`
Dutify HS Code Country	Indicates the country for which the HS Code applies.	`JP` for Japan - (use the ISO 3166 country code. Any other value will prevent calculation)

Tip: Use WooCommerce's product CSV exporter to bulk edit these attributes.

Product Classification

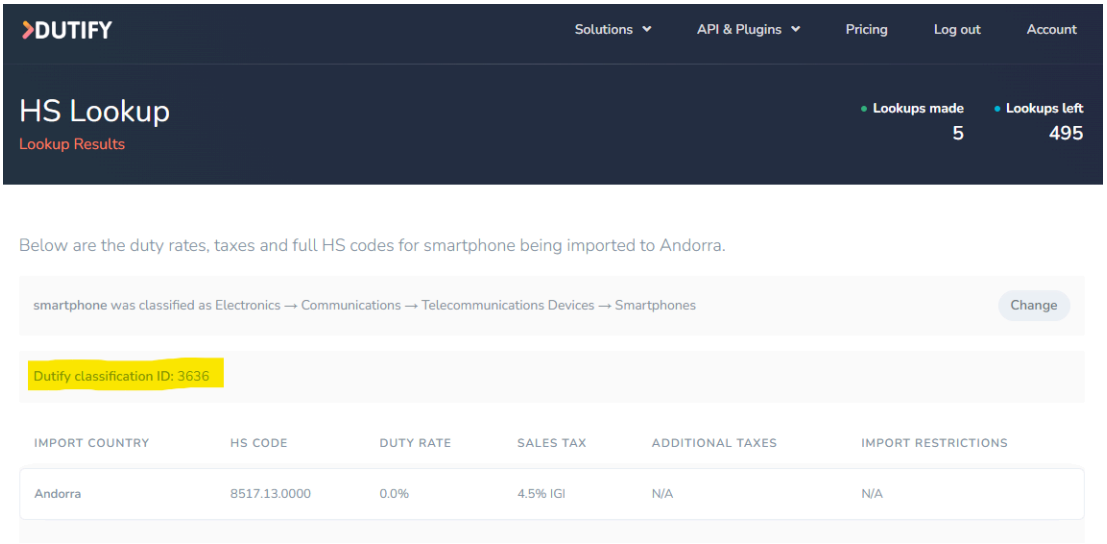
HS codes vary by destination country — only the first six digits are harmonised worldwide. For example, a leather backpack has one HS code in South Africa, three in the US, and four in the EU, each with different rates.

To calculate duties and taxes accurately, the correct HS code is required for each shipping country. Dutify solves this with a four-level product taxonomy mapped to full HS codes and rates. Each product type gets a unique **Classification ID**, enabling precise landed cost calculations for any supported country.

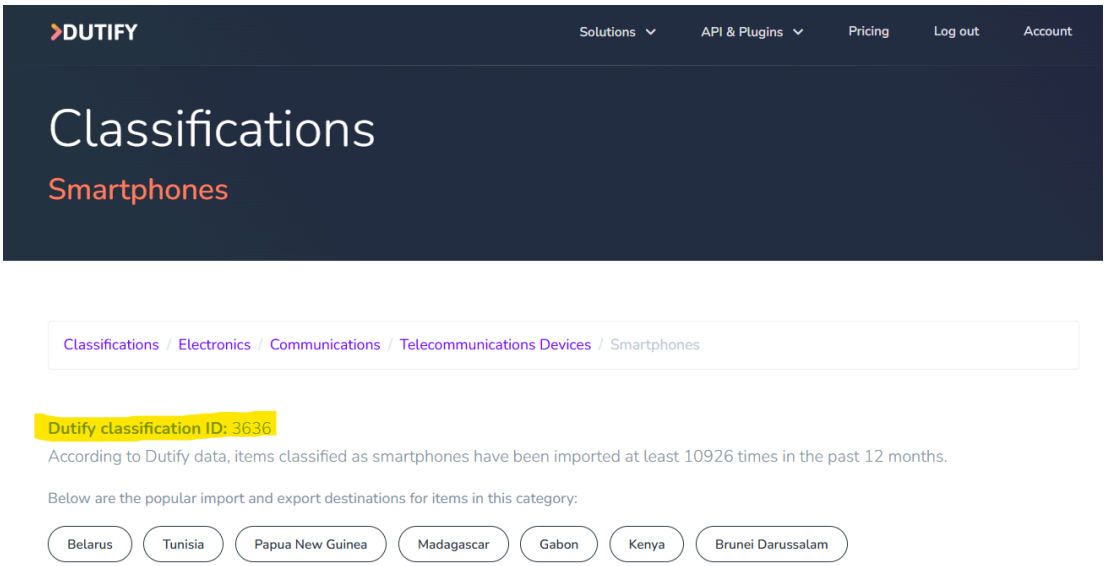
Retrieving Classification IDs

Classification IDs can be retrieved in a number of ways:

- Search for a product using our HS Lookup tool, the ID can be found on the results page:



- Browse our **Classifications** tree to find the relevant ID:



- Contact us for a full taxonomy export in CSV or Excel format.

Other Classification Methods

- **HS Code** – Enter a known HS code directly.
- **Automated Classification** – If no Classification ID or HS Code is set, Dutify will classify based on the product title (less accurate).
- **Managed Classification** – Dutify experts classify your catalog (paid service). Please contact us for more information.

Configuring Supported Countries

- Dutify currently supports **189 origin** and **104 destination countries**.
- The origin country is your WooCommerce **Store Address**; destination countries are your shipping countries.

- To enable/disable calculation for specific destination countries:
    1. On Dutify.com go to **Account** → **API Access**.
    2. Toggle countries to enable or disable duty and tax calculation as needed.
    3. Click **Save Configuration**.

Note: If shipping to a country that is not supported by Dutify or is disabled, the duties and taxes will not be calculated for that order.

Plugin Settings

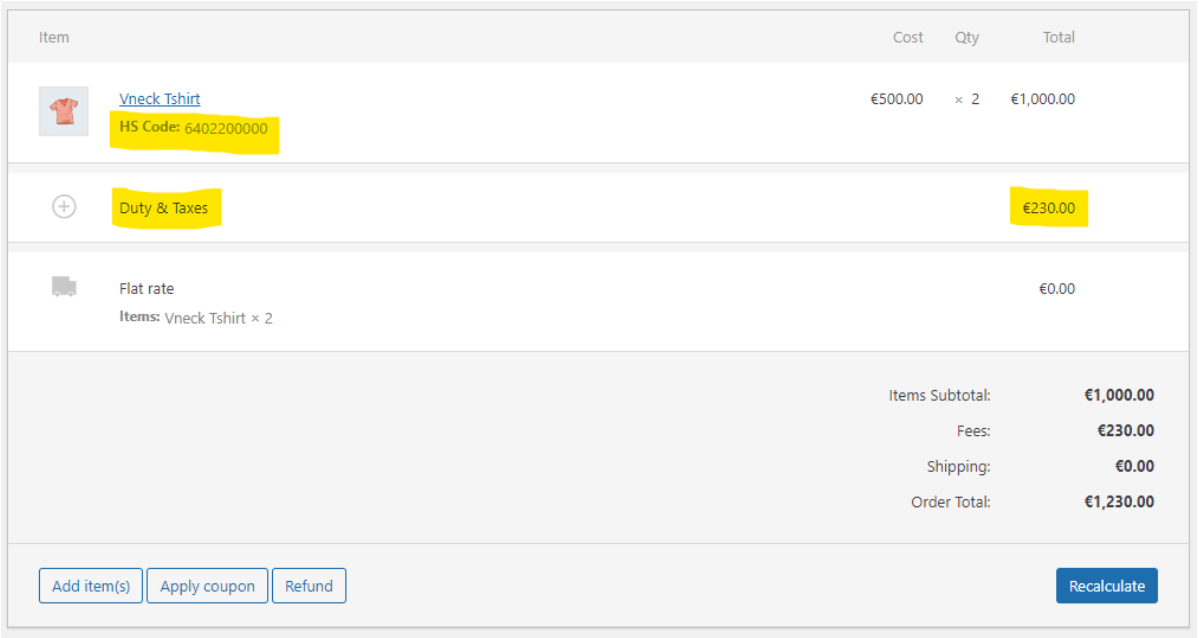
Go to **WooCommerce** → **Settings** → **Dutify**. After making any changes, **Save**.

- **Enable/Disable specific taxes** – By default, all duties and taxes are calculated. Disable a tax (e.g., VAT/GST) if another plugin or WooCommerce is already handling it.
    - *Recommendation:* Keep all enabled to avoid mismatched landed cost estimates.
- **Preferential rates** – Apply reduced rates when shipping with a certificate of origin. Check with your carrier before enabling as this is typically not offered with B2C shipping methods.
    - *Recommendation:* Usually leave disabled.
- **Do not collect duty & taxes (DDU)** – Shows duty/tax at checkout but does not charge it, using an offset line item instead. Useful for Delivery Duty Unpaid shipments.
- **Checkout only** – Calculates duty/tax only at checkout (reduces API calls).
    - *Recommendation:* Keep disabled to show estimates in both cart and checkout for better customer experience.
- **Duty & tax label** – Change the text shown for duty/tax in cart and checkout. Default: “Duty & Taxes”.
- **Handling fee label** – If a handling fee is set in your Dutify account, choose whether to display it separately or combine it with duty/tax. Leave blank to combine.
- **Do not collect duty & taxes (DDU) label** – If using the DDU feature, change the label for the offset charge. Default: “Duty & Taxes (payable on delivery)”.

Order Management & Audit

Fulfilling Cross-border orders

View duties & taxes and HS codes on the order details page in WooCommerce. Provide HS codes to your courier to ensure consistent classification when clearing customs in the destination country:



Auditing Calculations

Dutify saves every WooCommerce calculation. A full breakdown of each calculation including the individual taxes (e.g. duty, additional taxes, GST/VAT, etc.) and explanatory notes are available by:

1. On Dutify.com go to **Account** → **Landed Cost Calculations.**
2. Locate the desired calculation and click the **Description** to see a full calculation breakdown:
